Empathy Map

This empathy map captures the Bank Credit Analyst persona's perspective — what they Say, Think, Do, and Feel — while using the Credit Card Approval Prediction system to screen applicants. This helps the team build a customer-centric, trustworthy prediction tool.

SAYS • “I need a quick way to check if an applicant is high risk or low risk.” • “I don't want to manually recalculate risk scores for every application.” • “Show me the key factors driving each decision, not just a yes or no.”	THINKS • Is this model's prediction reliable given the limited sample dataset? • Will this tool save time without missing genuinely risky applicants? • I need to trust the score before backing an approval with my name.
Bank Credit Analyst <i>(Role: Credit Risk / Loan Approval Analyst)</i>	
DOES • Uploads a single applicant's details or a batch CSV file for prediction. • Reviews prediction history and downloads reports as PDF or Excel. • Cross-checks the model's output against company credit policy before the final decision.	FEELS • Reassured when predictions align with known risk indicators. • Cautious about relying fully on an automated score for real financial decisions. • Confident when historical model accuracy and metrics are shown transparently.
